### NEWS AND RESOURCES

## MINISTER BRUTON LAUNCHES €88 MILLION SFI RESEARCH CENTRE, BRINGING NEW INSIGHTS TO DATA ANALYTICS

# Insight Centre for Data Analytics

- Biggest single research investment ever by Science Foundation
- Biggest coordinated research programme in the history of the state
- Focus is on 'big data' related to health informatics and pHealth

Insight, the Centre for Data Analytics, will position Ireland at the heart of global Data Analytics research. The largest investment in a single research centre in the history of the state. Joining 4 universities, 30 industry partners, and 200 researchers in one multi-location research centre. Creating 300 direct jobs through 12 funded spin outs, as well as creating indirectly thousands of other job opportunities.

Research and Innovation, Mr Sean Sherlock T.D. today officially launched Insight, a new Science Foundation Ireland (SFI) Research Centre for Data Analytics. In a joint initiative between DCU, NUI Galway, UCC and UCD, the Centre will receive funding of €58 million from the Department of Jobs, Enterprise and Innovation through SFI's Research Centres Programme, along with a further contribution of €30 million from 30 industry partners. Insight represents a new approach to research and development in Ireland, by connecting the scientific research of Ireland's leading data analytics researchers with the needs of industry and enterprise.

## internet sensing

Dermot Diamond  
Dublin City University  
(Ireland)

Incredible advances in digital communications and computer power have profoundly changed our lives. One chemist shares his vision of the role of analytical science in the next communications revolution.

Digital communications networks are at the heart of modern society. The digitalization of communications, the development of the Internet, and the availability of relatively inexpensive but powerful mobile computing technologies have established a global communications network capable of linking billions of people, places, and objects. Email can instantly transmit complex documents to multiple remote locations, and websites provide a platform for instantaneous notification, dissemination, and exchange of information globally. This technology is now pervasive, and those in research and business have multiple interactions with this digital world every day. However, this technology might simply be the foundation for the next wave of development that will provide a seamless interface between the real and digital worlds.

The crucial missing part in this scenario is the gateway through which these worlds will communicate. How can the digital world sense and respond to changes in the real world? Analytical scientists—particularly those working on chemical sensors, biosensors, and compact, autonomous instruments—are

## Apple hiring medical device staff, shares break \$600 mark

0 Comments Recommend 7 Tweet 89 +1 ? Share

Apple Inc CEO Tim Cook

APPLE WATCH SPORT

The Sport collection cases are made from lightweight anodized aluminum in silver and space

## May 7<sup>th</sup> 2014

‘Over the past year, Apple has snapped up at least half a dozen prominent experts in biomedicine, according to LinkedIn profile changes.

# How will they integrate biosensing with the iWatch....?

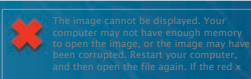

Much of the hiring is in sensor technology, an area Chief Executive Tim Cook singled out last year as primed to explode."

Industry insiders say the moves telegraph a vision of monitoring everything from blood-sugar levels to nutrition, beyond the fitness-oriented devices now on the market.'

"This is a very specific play in the bio-sensing space," said Malay Gandhi, chief strategy officer at Rock Health, a San Francisco venture capital firm that has backed prominent wearable-tech startups, such as Augmedix and Spire.

## Know The FreeStyle Navigator System

The **sensor** is placed on the back of your upper arm or your abdomen, and is held there with a special adhesive.

A tiny filament 5mm long—as thin as several strands of hair—goes just under the skin. It measures the glucose level in the interstitial fluid, which flows between the cells, and it's similar to measuring the blood glucose level.\*

Adhesive Support Mount

Transmitter

Receiver

The **transmitter** is attached to the sensor and sends

glucose readings to the receiver.

You can wear the sensor/transmitter for up to 14

days.

For more information, visit [www.freestyle.com](#)

or call 1-800-428-6288.

© 2008 Abbott Diabetes Care. All rights reserved.

The **receiver** is like a little computer. It stores all your glucose readings, for up to 60 days, and it gives you an accurate picture of what your glucose is doing. You can program it to predict out-of-range highs and lows based upon thresholds you set, and it lets you know with alarms<sup>1</sup> if any are heading towards high and lows so you can take action to avoid them.

The receiver is also the only CGM device on the market to have a built-in blood glucose meter for convenient calibration—no need for a separate device.

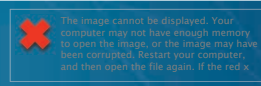

Combines microfluidics with a micro-dimensioned filament sampling unit which is designed to minimise incidence of infection

Target is for several days (up to 7) continuous monitoring; then replace

Use model is good – short periods of use, regular replacement, coulometric detection (no calibration if the enzyme reaction is specific)

advance.

Wireless communications used to harvest data continuously, and relay to carers and specialists. Enables trending, aggregation, warning....

# Google Contact Lens

Google Smart Contact Lenses Move

Kind Code A1 Liu; Zenghe April 17, 2014

Closer to Reality

- Use model is 24 hours max, then replace;
- likely to leverage Google Glass\* infrastructure;
- Novartis now working with Google.

Microelectrodes  
Sensor

Abstract

An eye-mountable device includes an electrochemical sensor embedded in a polymeric material configured for mounting to a substrate. The electrochemical sensor includes a working electrode, a reference electrode, and a reagent that selectively reacts with an analyte to generate a sensor measurement of a concentration of the analyte in a fluid to which the eye-mountable device is exposed.

Google's Smart Contact Lens is like your contact lens, except it's a whole lot smarter.

\*Google Glass project has been abandoned! (Jan 15 2015) see

Fig. 2. Images of the sensor as it goes through surface functionalization and the related measured responses: (a) sequential images of sensor pre-treatment with GOD/titanium/Nafion®; (b) measured amperometric response for the sensor just incubated with GOD; (c) measured amperometric response for the sensor prepared with GOD/titanium sol-gel film; (d) measured amperometric response for the sensor prepared with GOD/titanium/Nafion®; (e) three controls (signals for buffer) for the same pre-treatment of (b), (c), and (d); (f) the enlarged view of curve (b) and control of (b) for 120–360s.

# Remote (Continuous) Sensing Challenges: Platform and Deployment Hierarchies

**Physical Transducers –low cost, reliable, low power demand, long life-time**

Thermistors (temperature), movement, location, power,, light level, conductivity, flow, sound/audio, .....

**Chemical Sensors – more complicated, need regular calibration, more costly to implement**

Electrochemical, Optical, .. For metal ions, pH, organics...

**Biosensors – the most challenging, very difficult to work with, die quickly, single shot (disposable) mode dominant use model**

Due to the delicate nature of biomaterials enzymes, antibodies....

**Increasing difficulty & cost**

**Increasing scalability**

**Gas/Air Sensing – easiest to realise**

Reliable sensors available, relatively low cost

Integrate into platforms, develop IT infrastructure, GIS tools, Cloud Computing

**On-land Water/ Monitoring**

More accessible locations

Target concentrations tend to be higher

Infrastructure available

**Marine Water**

Challenging conditions

Remote locations & Limited infrastructure

Concentrations tend to be lower and tighter in range

# Change in Electrode Function over Time

See *Electrochimica Acta* 73 (2012) 93–97

stored in  $10^{-9}\text{M Pb}^{2+}$ , pH=4

Continuous contact with river water

PVC-membrane based ISEs

# Current Analyser Design

...

# Chem/Bio-sensors do not stay in calibration long enough

- If each sensor has an in-calibration lifetime of 1 day....
- And these sensors are very reproducible....
- And they are very stable in storage (up to several years)

....

Then 100 sensors when used sequentially could provide an aggregated in-use lifetime of around 3 months

But now we need multiple valves integrated into a fluidic platform to select each sensor in turn

# How to advance fluid handling in LOC platforms: re-invent valves (and pumps)!

- **Conventional valves cannot be easily scaled down - Located off chip: fluidic interconnects required**
  - Complex fabrication
  - Increased dead volume
  - Mixing effects
- **Based on solenoid action**
  - Large power demand
  - Expensive

**Solution: soft-polymer (biomimetic) valves fully integrated into the fluidic system**

# Photoswitchable Actuators

# Poly(*N*-isopropylacrylamide)

- pNIPAAm exhibits inverse solubility upon heating
- This is referred to as the LCST (Lower Critical Solution Temperature)
- Typically this temperature lies between 30-35°C, but the exact temperature is a function of the (macro)molecular microstructure
- Upon reaching the LCST the polymer undergoes a dramatic volume change, as the hydrated polymer chains collapse to a globular structure, expelling the bound water in the process

## pNIPAAm

Hydrophilic

Hydrated Polymer Chains

Hydrophobic

Loss of bound water  
-> polymer collapse

# Reversible Photo-Switching of Flow

**Above:** scheme showing switching process protonated MC-H<sup>+</sup> photoswitched to SP triggering p(NIPAAAM-co-AA-co-SP) gel contraction and opening of the channel.

**Right, Top:** Photos of the valve in operation before (flow OFF) and after (flow ON) one minute of blue light irradiation.

**Right, Bottom:** Flowrate and cumulative volume measurements showing repeated opening and closing of microvalve: 1 min blue light irradiation opens valve followed by ~5.5 min thermal relaxation to close.

From: 'Molecular design of light-responsive hydrogels, for in-situ generation of fast and reversible valves for microfluidic applications' *Chemistry of Materials* (2015), accepted.

# Chemotactic Systems

In a pH gradient,  $\text{DA}^-$  is preferentially transferred to the aqueous phase at the more basic side of the drop.

Published on Web 11/01/2010 (speed  $\sim x4$ ): channels filled with KOH (pH 12.0-12.3 + surfactant; agarose gel soaked in HCl (pH 1.2) sets up the pH gradient; droplets of mineral oil or DCM containing 20-60% 2-hexyldecanoic acid + dye. Droplet speed ca. 1-10 mm/s; movement caused by convective flows arising from concentration gradient of HDA at droplet-air interface (greater concentration of  $\text{DA}^-$  towards higher pH side);  $\text{HDA} \leftrightarrow \text{H}^+ + \text{DA}^-$

**Maze Solving by Chemotactic Droplets;** Istvan Lagzi, Siowling Soh, Paul J. Wesson, Kevin P. Browne, and Bartosz A. Grzybowski; *J. AM. CHEM. SOC.* 2010, 132, 1198–1199

Fuerstman, M. J.; Deschatelets, P.; Kane, R.; Schwartz, A.; Kenis, P. J. A.; Deutch, J. M.; Whitesides, G. M. *Langmuir* 2003, 19, 4714.

# We can do the same with IL Droplets

Trihexyl(tetradecyl)phosphonium chloride ( $[\text{P}_{6,6,6,14}][\text{Cl}]$ ) droplets with a small amount of 1-(methylamino)anthraquinone red dye for visualization. The droplets spontaneously follow the gradient of the  $\text{Cl}^-$  ion which is created using a polyacrylamide gel pad soaked in  $10^{-2}$  M HCl; A small amount of NaCl crystals can also be used to drive droplet movement.

*Electronic structure calculations and physicochemical experiments quantify the competitive liquid ion association and probe stabilisation effects for nitrobenzospiropyran in phosphonium-based ionic liquids, D. Thompson et al., Physical Chemistry Chemical Physics, 2011, 13, 6156-6168.*

# 2D chemotactic droplet movement

- NaOH in petri dish; HCl with indicator dye added from tubes in sequence
- Droplet moves spontaneously towards acidic locations
- In 2/3 cases, the droplet enters the source tube
- Droplets can be loaded with monomeric units that polymerise inside the tubing sealing off the source of the 'leak'

# We must go from this:

# To Photo-Fluidics & Detection

- **Fluidic handling completely integrated into the microfluidic chip**
  - Valves actuated remotely using light (LEDs)
  - Detection is via LED colorimetric measurements
  - Photo-controlled uptake and release

# And Ultimately – to Bioinspired Multi-Functional Fluidics

- **In the future, the fluidic system will perform much more sophisticated ‘bioinspired’ functions**
  - System diagnostics, leak/damage detection
  - Self-repair capability
  - Switchable behaviour (e.g. surface roughness, binding/release),
- **These functions will be inherent to the channels and integrated with circulating smart micro/nano-vehicles**
  - Spontaneously move under an external stimulus (e.g. chemical, thermal gradient) to specific locations

# Time to re-think the game!!!

- **New materials with exciting characteristics and unsurpassed potential...**
- **Combine with emerging technologies and techniques for exquisite control of 3D morphology**
- **And greatly improved methods for characterisation of structure and activity**

**We have the tools – now we need creativity!**

**Thanks for listening**
